**IMPORTANT:** Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

**Comments:** Sampled stream at inlet and outlet of Cabin Lake. Streams were sampled using minnow buckets baited with cured salmon roe placed in the area of the USFS Cabin Lake picnic grounds. Three traps were set for 15 minutes. Two traps set about 50 yds upstream of the inlet yielded 3 coho juveniles. One trap set downstream of the outlet yielded 5 coho juveniles. Fork lengths ranged between 65 & 110 mm. Stream had stained tannic water, good riffles and pools, large woody debris and undercut banks.
